## 1 Color Picker

Write the javascript for a simple page where you can input a color (either the name of a color, or the hex code for a color) and the page background turns the color you entered.

I've provided the html. All you need is to write the file `color_picker.js`.

### Getting started

1. Click on the link on the class webpage for the color-picker HTML and save it on your desktop as `color_picker.html`.
2. Open the file you just saved in a browser. Try changing the color. It shouldn't work.
3. Open a text editor and make a file called `color_picker.js`. Write your javascript there.

### Debugging advice

- To test whether a function is being called, put an `alert` in it.
- To test what a particular variable's value is somewhere, use `alert([variable_name])`.

Turn in your javascript via email so I can test it.
